EVOLUTION AQUA

INNOVATION IN WATER

Easy to install a UV

eazypod™

Now easy to install an internal UV

All EazyPod filters can now be easily upgraded to include an Evolution Aqua 18 Watt UV on the inlet section, previously only available with EazyPod Complete models.

- Use as a standard EazyPod straight out of the box
- If a UV is required simply purchase an easy to install CUV-118
- No need to replace the entire filter or fit a UV on your pipework

UV upgrade kit available from Evolution Aqua stockists

INTRODUCING THE EAZYPOD

Please read this instruction manual carefully from start to finish before attempting to install your EazyPod on Pump-Fed or Gravity-Fed installations.

EazyPod Air models follow the same instructions but are supplied with a 70 litre per minute Air Pump Kit.

EAZYPOD PARTS

Your EazyPod / EazyPod Air comes complete with the following items:

EAZYPOD AND LID

2 x 1½" HOSETAIL AND O-RING
(Small pre-cut size for inlet and full hosetail for waste slide valve)

4 TO 3 INCH EAZYCONNECTOR
(For outlet)

K1 MICRO FILTER MEDIA
(18 Litres)

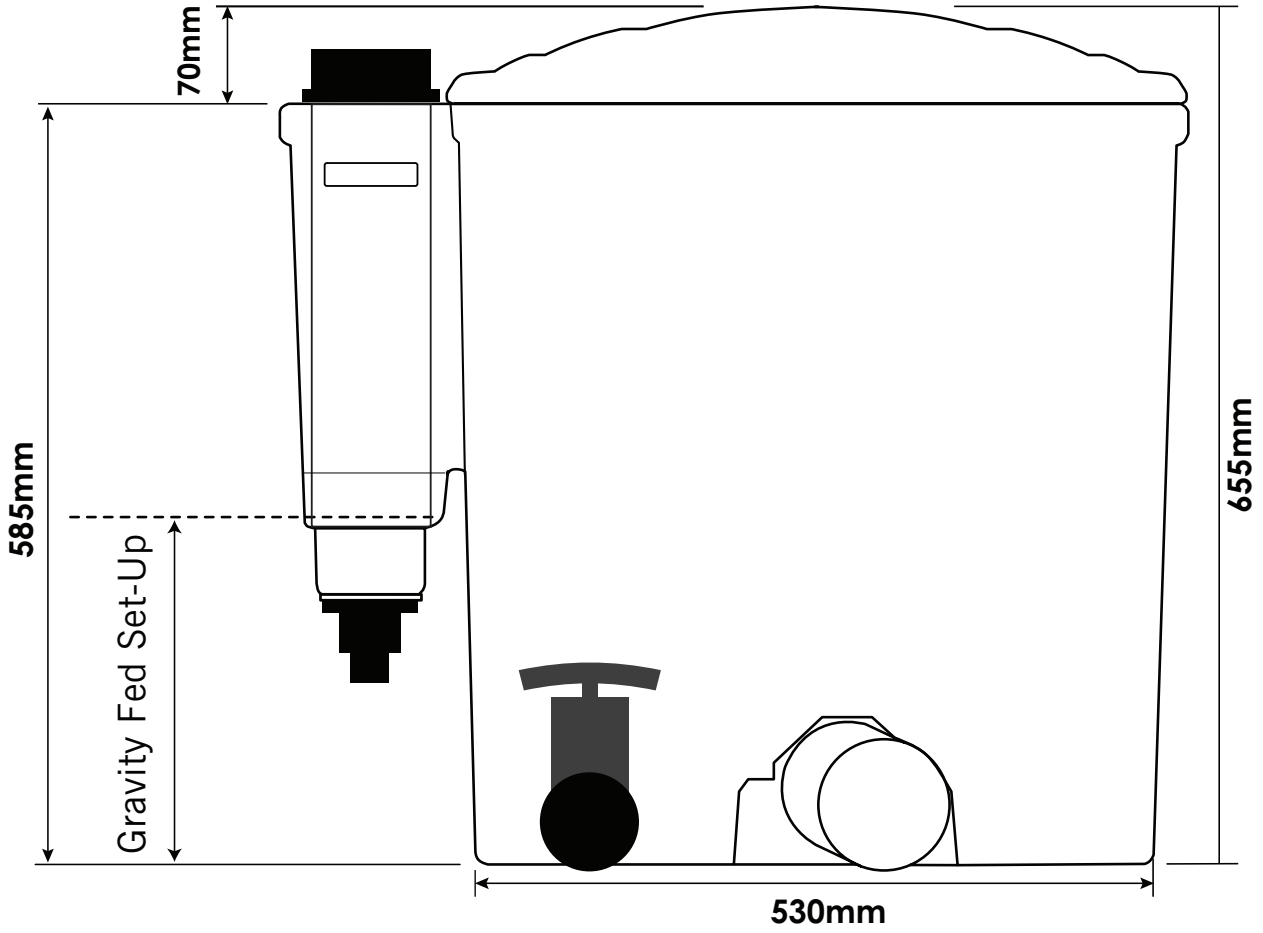

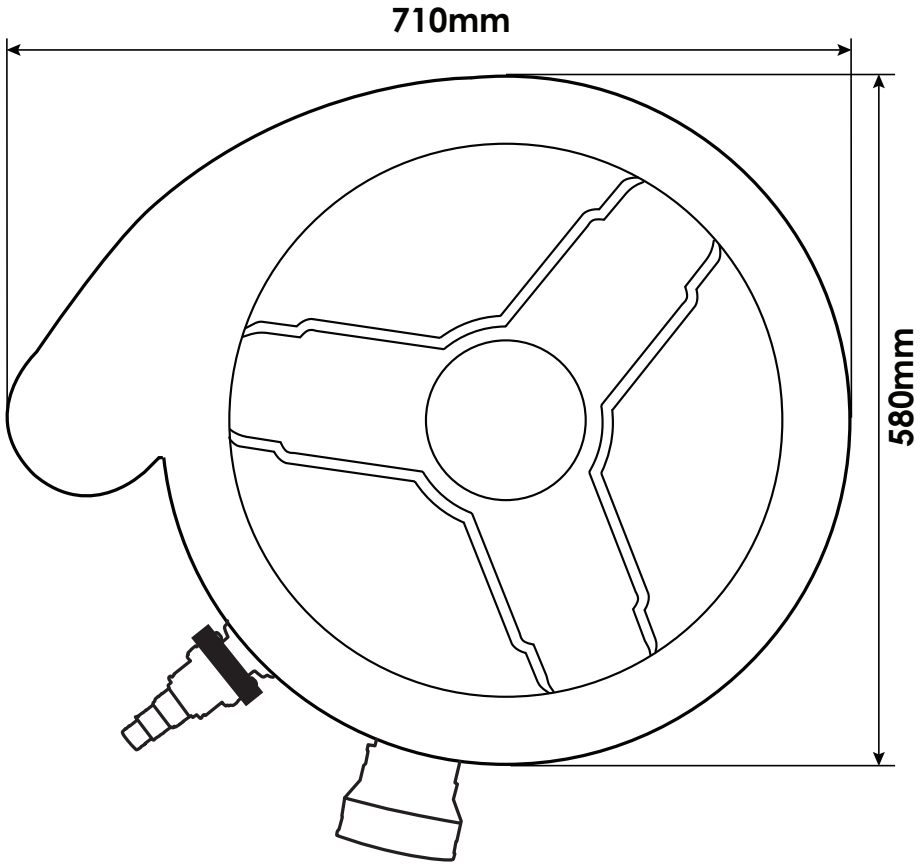

CLEANING PIPE

EAZYPOD AIR MODELS ALSO INCLUDE:

- Air Pump 70
- 10m roll of silicone air line
- 4 port chrome manifold
- Airstone
- Rubber Elbow
- 2cm silicone tubing
- 10cm Airline (12mm)
- 12mm Tee
- 80cm Airline (12mm)

DIMENSIONS

HOW THE EAZYPOD WORKS

The concept is simple and yet innovative. Water enters via the inlet **A** and enters the outer chamber **B**, which runs around the entire circumference of the EazyPod. Between **B** and the central chamber **C**, is a stainless steel perforated screen. These perforations are situated in the lower half of the screen and around its entire face. This means that when the water passes from the outer to inner chamber (**B** to **C**), a downward flow is created. This causes many of the larger solids to settle in the base of the outer chamber, due to the force of gravity.

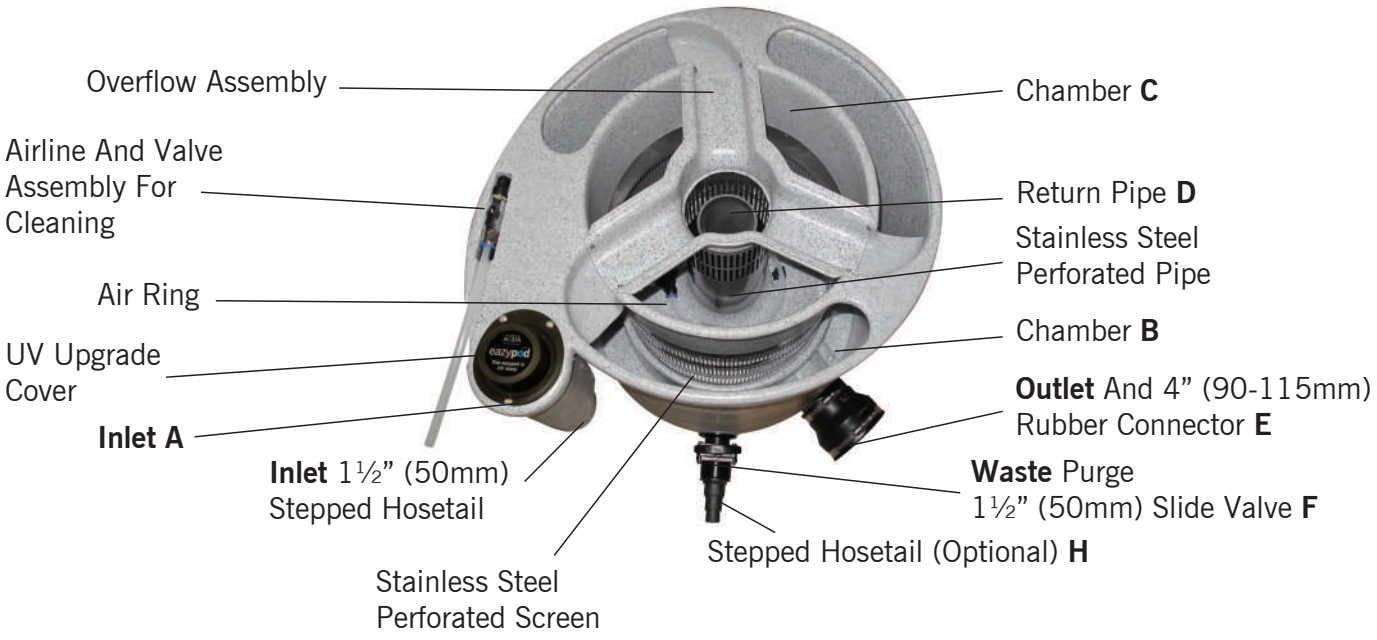

The size of the perforations will not allow large mechanical waste to enter the central chamber, thus acting as a first stage mechanical filter. The central chamber holds **18 litres** of static K1 Micro. As the water enters the central chamber, the fine smaller solids become entrapped in the K1 Micro. After passing through the K1 Micro, the clean water then rises and overflows into the inner return pipe **D** of the EazyPod. From here it returns to the pond via the return outlet **E**.

The EazyPod filtration system gives water quality and clarity that surpasses all expectations. The nature and volume of the K1 Micro means, that when static, apart from being a very efficient mechanical filter, there is more than enough surface area for beneficial bacteria to colonise. Therefore on a smaller pond, the EazyPod is an excellent complete filter.

PLEASE NOTE that in normal running, the K1 Micro has to be static – it is only moved during cleaning and maintenance. If the K1 Micro is moved in normal operation, whether by air or by hand, all of the debris it has collected will be returned to the pond! The K1 Micro is cleaned and moved by connecting an air pump to the air line in the EazyPod, which in turn goes to an air ring in the base of chamber **C**. This has small holes which cause the K1 Micro to move and therefore clean itself.

During the cleaning cycle, the finer particles escape into chamber **B** from the K1 Micro.
This waste water can then be dumped via a 1.5 inch / 50mm slide valve **F**.

Please check the table opposite to make sure you run your EazyPod within the specified limits to achieve best results.

EAZYPOD SPECIFICATIONS AND FLOW RATES

The EazyPod is truly multi-functional. It can be run in several different ways for different applications.

The EazyPod can be used:

- as a complete filter on a quarantine system
- as a pre-filter at the front of any new or existing system
- as a polisher at the end of any system
- off a mid water feed to aid mechanical filtration
- on a skimmer line as a mechanical filter

Remember that if you use the EazyPod solely as a mechanical filter, you will also get an enhanced biological benefit in your system.

EazyPod Specifications and Flow Rates

One of the factors that can have a significant influence on our ponds is the **turn over** rate. This is the time that it takes for the total water volume of the pond to pass through the filter system once.

The optimum flow rate through the EazyPod is 5,000 litres per hour, and this can be adjusted to suit the desired turn over rate for the pond which should be once every 1 - 2 hours.

Therefore, if you have a 10,000 litre pond a recommended flow rate of 5,000lph gives a turnover rate of 2 hours.

A slow flow through the filter will give optimum performance but if a higher turnover rate is required the flow must not exceed 10,000 lph.

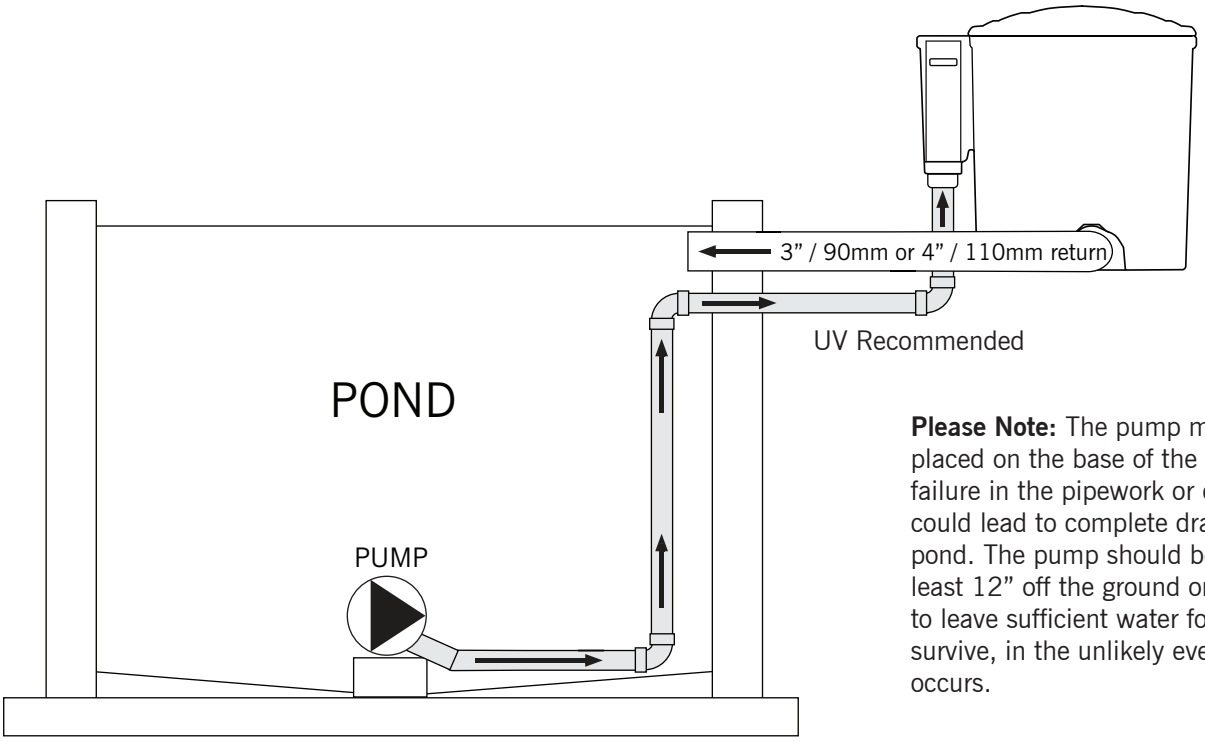

Max pond size:	10,000 litres	2,200 UK gallons	2,640 US gallons
Recommended flow rate:	5,000 litres/hr	1,100 UK gallons/hr	1,320 US gallons/hr
Max flow rate:	10,000 litres/hr	2,200 UK gallons/hr	2,640 US gallons/hr
Volume of water in filter:	80 litres	18 UK gallons	21 US gallons
Amount of K1 Micro supplied:	18 litres		
Max feed rate:	100 - 125g per day		
Recommended Air Pump:	EA Air Pump 70 or EA Air Pump 75		

INSTALLATION CONSIDERATIONS

PLEASE NOTE: EazyPod is supplied ready to be used on a **PUMP-FED SET-UP ONLY**. To use the EazyPod on **GRAVITY FED SET-UPS** you need to make some modifications to the EazyPod as outlined later in this manual.

PUMP-FED SET-UP

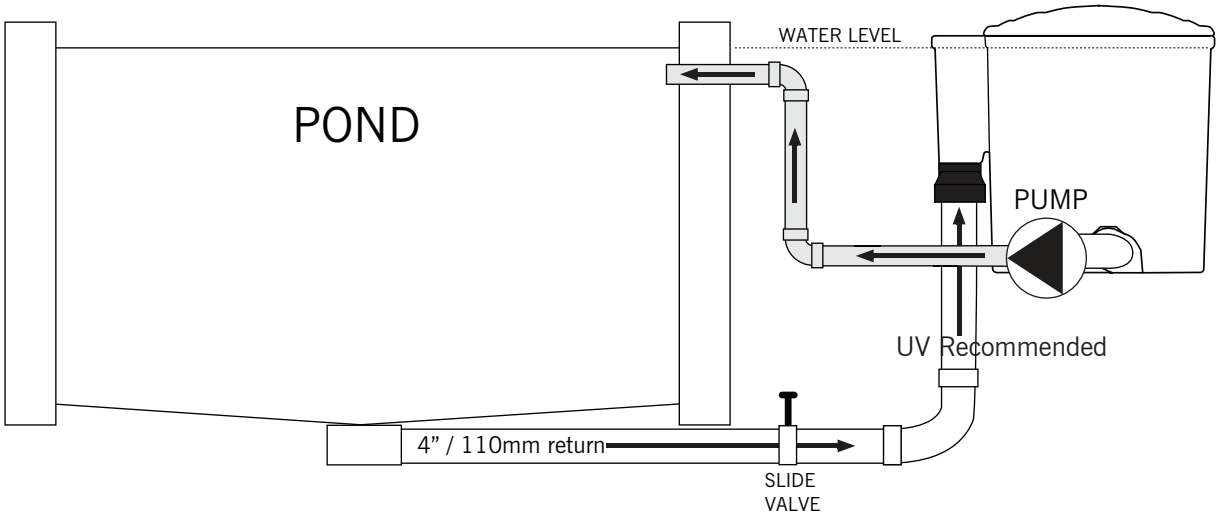

If you require a set-up where the pump is situated in the pond supplying water to the EazyPod which is situated above the water level, you will be installing the filter on a **PUMP-FED SET-UP**. Follow the instructions on pages 9 to 12 for the pump-fed installation instructions.

Please Note: The pump must not be placed on the base of the pond, as failure in the pipework or connectors could lead to complete drainage of the pond. The pump should be raised at least 12" off the ground or high enough to leave sufficient water for the fish to survive, in the unlikely event that this occurs.

GRAVITY FED SET-UP

If you require a set-up where the pond has a bottom drain supplying water to the EazyPod and a pump returns water back to the pond, you will be installing the filter on a **GRAVITY-FED SET-UP.** Follow the instructions on pages 13 to 17 for the gravity-fed installation and cleaning instructions.

PUMP-FED SET-UP AND INSTALLATION INSTRUCTIONS

SETTING UP THE EAZYPOD FOR PUMP-FED INSTALLS

To set up your EazyPod ready for use, follow these simple steps:

FIT THE INLET HOSETAIL

STEP 1: Fit O-Ring on the hosetail thread of the inlet hosetail.

STEP 2: Screw the hosetail into the inlet thread.

STEP 3: Ensure the hosetail is hand tightened until the rubber O-ring seals on the inlet face. (DO NOT OVERTIGHTEN)

FIT THE EAZY CONNECTOR ON THE OUTLET PIPE

Fit the 4”-3” EazyConnector onto the outlet pipe and tighten the jubilee clip with a flat head screwdriver.

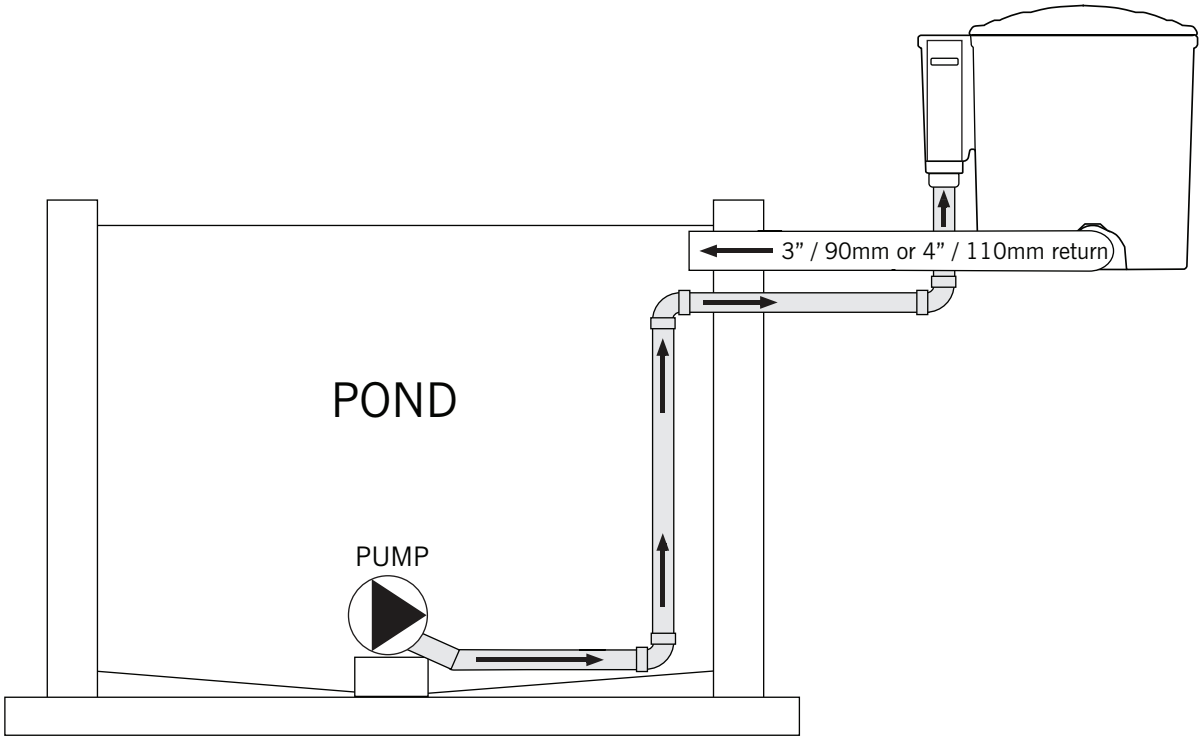

PUMP-FED INSTALLATION

PLEASE NOTE: EazyPod is supplied ready to be used on a **PUMP-FED SET-UP ONLY**. To use the EazyPod on Gravity Fed set-ups you need to make some modifications to the EazyPod as outlined later in this manual.

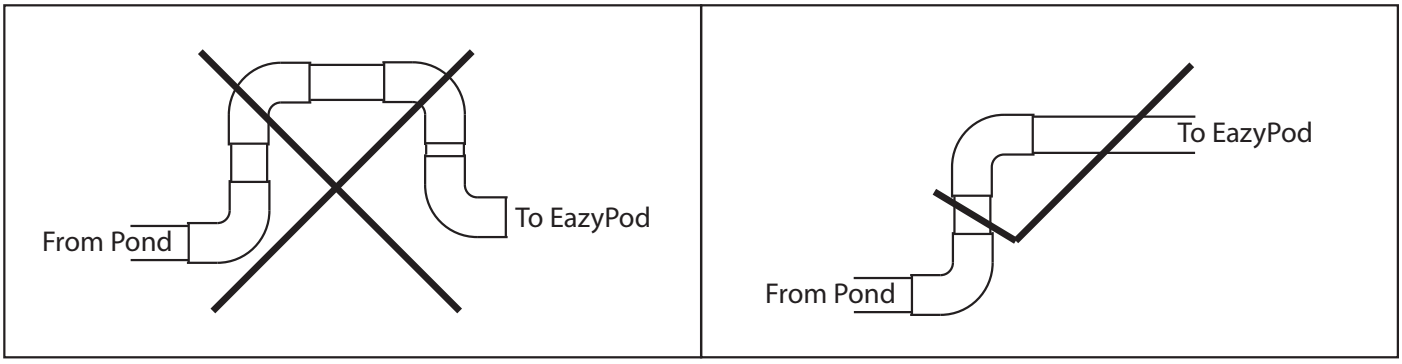

The diagram below shows the EazyPod on a typical Pump-Fed set-up.
A Pump-Fed set-up is when water is pumped from the pond to the filter.

PLEASE NOTE: The pump must not be placed on the base of the pond, as failure in the pipework or connectors could lead to complete drainage of the pond. The pump should be raised at least 12" off the ground or high enough to leave sufficient water for the fish to survive, in the unlikely event that this occurs.

IMPORTANT: A solid, level base is required for the EazyPod. It should be a minimum of 600mm x 600mm, to allow easy access to your valves and for maintenance purposes.

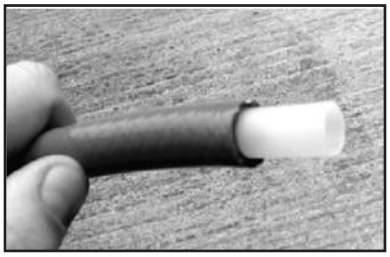

The EazyPod filter needs to be supported evenly on a level base (a paving flag is ideal). Failure to do so could cause damage when it is full of water.

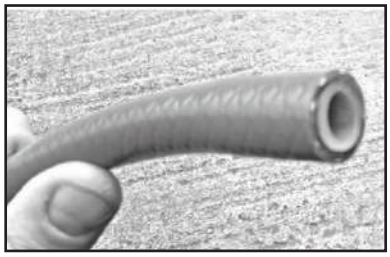

PUMP-FED INSTALLATION

INSTALLATION EQUIPMENT

1. **Pond Pump**. Please ensure that the pump's maximum actual flow rate is no more than the specified limits (see page 7).
2. **Pipework** from the unit's waste valves to the intended discharge point.
2. **Air Pump** for cleaning the K1 Micro. An EA Air Pump 70 or 75 is recommended.
3. **A length of garden hose or braided pipe** (10 mm inner diameter) to connect your air pump to the air ring in the EazyPod.
4. **Tip:** When connecting to your air pump, cut an inch from the airline supplied on the EazyPod. Insert this into the hosepipe that connects to the air pump. This will help maintain the hosepipe's rigidity when inserting it into the rubber connector and clip supplied with your air pump.

5. **Pipework** from the unit's waste valves to the intended discharge point. This can be rigid pipework or a simple flexible hose of at least 1" diameter.

The EazyPod comes ready to be installed on a **PUMP-FED** set-up - no changes to any of the fittings are required.

The EazyPod should be situated at a height above the pond water level, to allow adequate gravity return to the pond *(subject to the maximum performance of your chosen pump)*.

The gravity return pipework from the exit point of the EazyPod to the pond needs to be a minimum of 3 inches (90mm), 4" (110m) for flow rates over 7,500 litres per hour and should have no restrictions. Great care should be taken to ensure that no air locks are created within the gravity return pipework. The return pipe should have an "appropriate fall" from the EazyPod to the pond.

The pipework from the pond pump to the inlet of the EazyPod will need to be connected to the 1.5 inch (50mm) inlet hosetail **(K)**. The 4 inch / 90-115 mm (minimum) gravity return pipework will need to be connected to the rubber adaptor **(I)** on the outlet point of the EazyPod.

This fitting when first connected to this pipe could appear too big (especially 90mm) or too large 4" (115mm) – it will however reduce/stretch with the clip provided and make a tight seal – this is done with a screwdriver. The return pipe is then extended and returned to the pond or waterfall as required.

It is important to be able to isolate the EazyPod for maintenance purposes. Therefore we recommend that you install an isolating valve (3" or 4" inch / 90-115 mm slide or ball valve) on your inlet gravity line before the EazyPod.

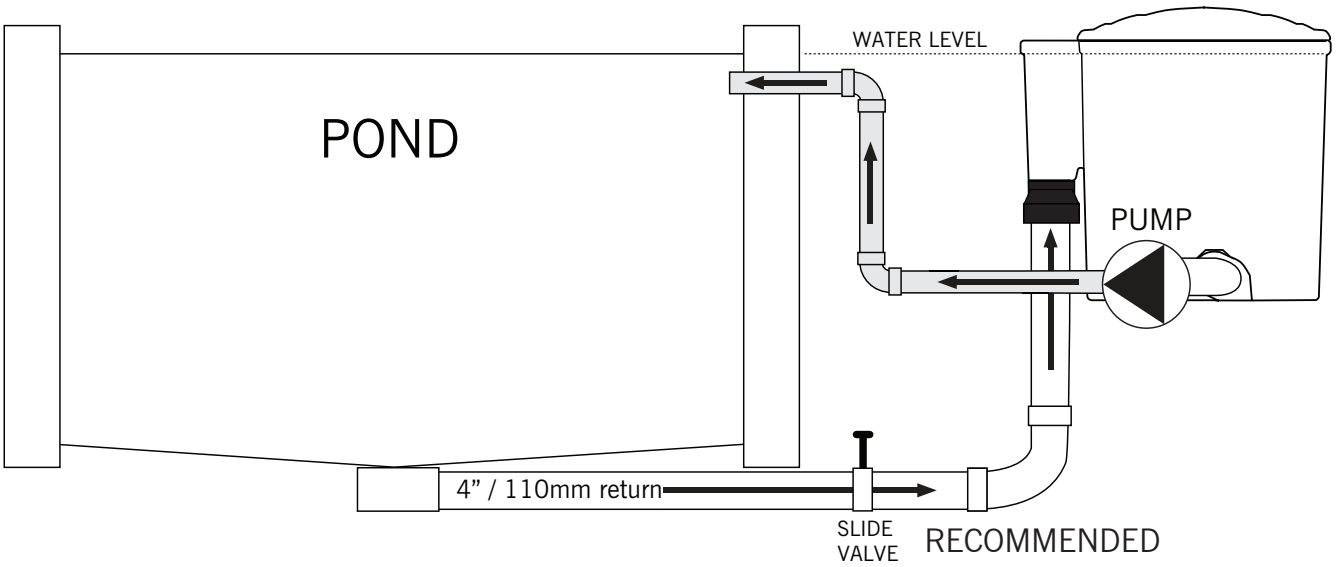

GRAVITY-FED INSTALLATION INSTRUCTIONS

SETTING UP THE EAZYPOD ON GRAVITY-FED INSTALLS

PLEASE NOTE: EazyPod is supplied ready to be used on a **PUMP-FED SET-UP ONLY**. To use the EazyPod on **GRAVITY FED SET-UPS** you need to make some modifications to the EazyPod as outlined over the following pages.

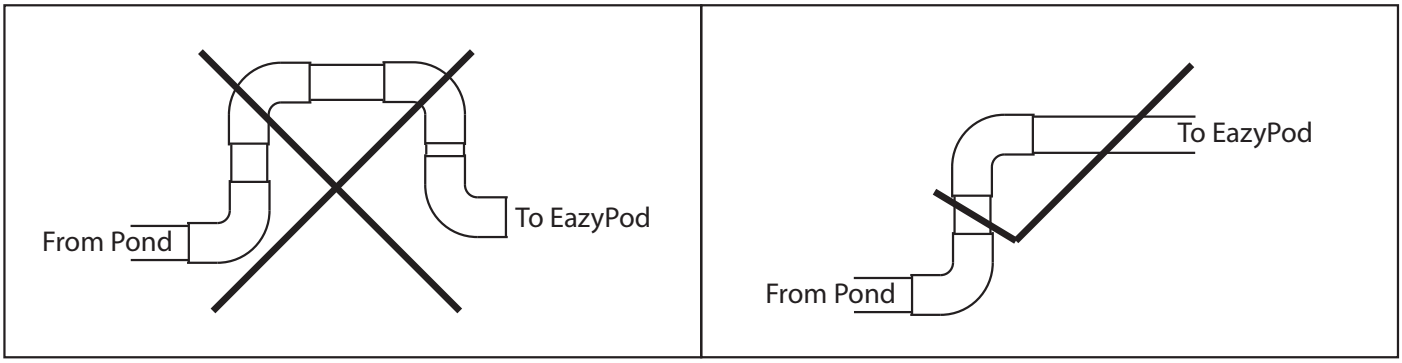

The EazyPod must be situated at pond water level. That is to say, that when the circulating pump is switched off, water is level with the overflow assembly. This level will lower when in operation.

The rubber connector on the outlet port must be swapped over so that on the inlet you will have the optional 3 or 4 inch (90-115mm) rubber connector to take your pipework from the pond and on the outlet you will have the 1.5 inch (50mm) connector for your return pressure line. You can install a slide valve before your pump, to isolate it, if your pump has a 2½ inlet. The gravity pipework needs to be 4" (110mm) for flows over 7500 litres per hour.

IMPORTANT: A solid, level base is required for the EazyPod. It should be a minimum of 600mm x 600mm, to allow easy access to your valves and for maintenance purposes.

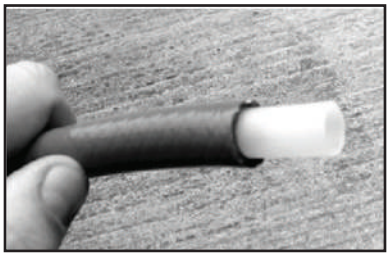

The EazyPod filter needs to be supported evenly on a level base (a paving flag is ideal). Failure to do so could cause damage when it is full of water.

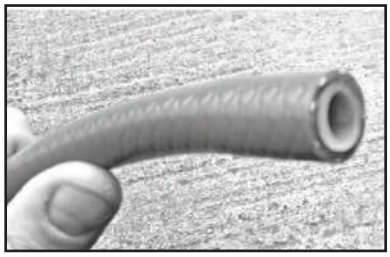

SETTING UP THE EAZYPOD ON GRAVITY-FED INSTALLS

INSTALLATION EQUIPMENT

1. **Circulating Pump**. Please ensure that the pump's maximum actual flow rate is no more than the specified limits (see page 7).
2. **Pipework** from the unit's waste valves to the intended discharge point.
2. **Air Pump** for cleaning the K1 Micro. An EA Airpump 70 or 75 is recommended.
3. **A length of garden hose or braided pipe** (10 mm inner diameter) to connect your air pump to the air ring in the EazyPod.
4. **Tip:** When connecting to your air pump, cut an inch from the airline supplied on the EazyPod. Insert this into the hosepipe that connects to the air pump. This will help maintain the hosepipe's rigidity when inserting it into the rubber connector and clip supplied with your air pump.

5. **Pipework** from the unit's waste valves to the intended discharge point. This can be rigid pipework or a simple flexible hose of at least 1" diameter.

It is important to be able to isolate the EazyPod for maintenance purposes. Therefore we recommend that you install an isolating valve (3" or 4" inch / 90-115 mm slide or ball valve) on your inlet line before the EazyPod.

SETTING UP THE EAZYPOD ON GRAVITY-FED INSTALLS

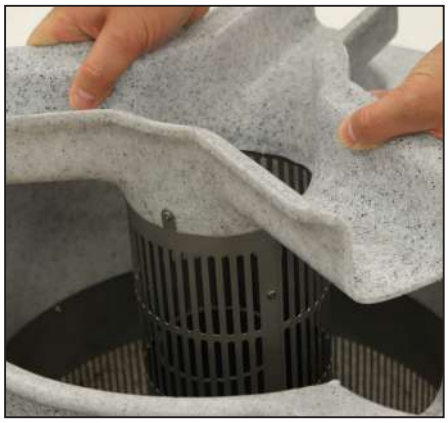

IMPORTANT... For gravity fed installations, you will need to reverse the exit pipe so that the return pipe is lower. This is because the exit pipe although crucial for a pump-fed system would impede a gravity unit when the media starts to filter out the debris altering the water level.

1. Locate all six screws on the overflow section. Use a Philips screwdriver to unscrew each one.

2. Take note of where the overflow is located before removing the final screw. Keep the screws safe.

3. Pull the plastic overflow section out which is also connected to the perforated stainless steel section.

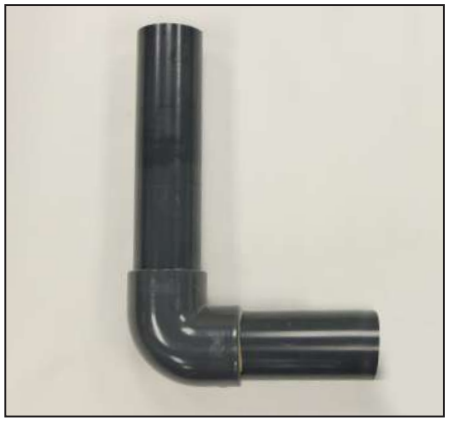

4. Inside the centre of the EazyPod, loosen the upper clip on the EazyConnector.

5. Turn the EazyPod on its side, unscrew the 4 screws on the support bracket to remove it.

6. Pull out the 90mm return pipe assembly from the EazyPod body.

NOTE: The pipe assembly is comprised of 1 long length and 1 short length joined by a 90 bend.

7. If there is an EazyConnector on your outlet pipe, you need to remove it.

8. Refit the pipe assembly by pushing the shorter end back into the EazyPod, so that the long length is now the exit.

SETTING UP THE EAZYPOD ON GRAVITY-FED INSTALLS

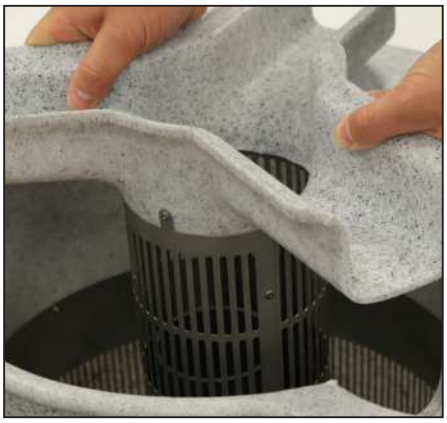

IMPORTANT... You will also need to remove and discard the black inlet pipe that is located within the inlet section. This can only be removed by carefully sawing the inlet section at the measurements shown below. You may need to tap on the top of the EazyPod inlet to dislodge the black pipe.

9. Re-fit the 4 screws to the plastic pipe support.

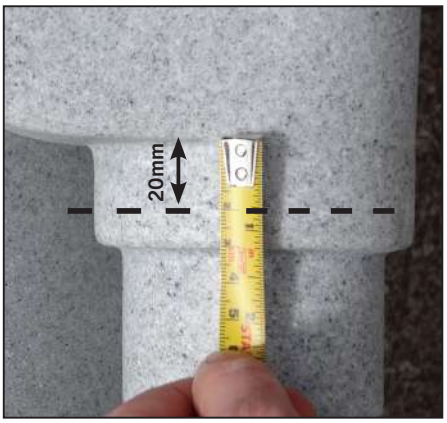

10. Turn the Eazypod over and tighten up the EazyConnector on the centre pipe to form a water tight seal.

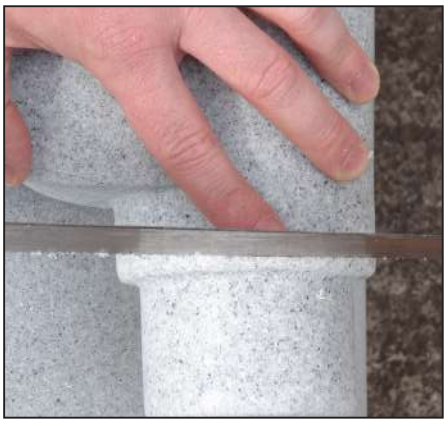

11. Replace the overflow assembly and re-screw into the housing.

12. Re-fit the overflow section in correct location and screw all 6 screws back in.

13. On the inlet, measure 20mm down from the shoulder of the inlet section.

14. Using a hacksaw, cut across the inlet at the measurement shown.

15. Inside the inlet, there is a black pipe which you should pull out of the inlet. Discard the black pipe.

16. Fit the 4" to 3" EazyConnector onto the inlet you have just cut. Make sure the connector is pushed up tight.

17. Tighten up the jubilee clip using a flat head screwdriver or nut-runner.

AIR PUMP INSTALLATION

Air Pump Installation (Pump + Gravity Fed)

Now that you have your EazyPod installed, you will need to connect your air pump to the EazyPod for the cleaning cycle. This will agitate the K1 Micro so that the waste which has collected in the media can be removed from the system. We recommend an EA Airpump 70 or 75.

The air pump is connected to the air ring inlet using a garden hose or braided pipe (10 mm inner diameter). The air ring inlet is positioned on the outside of the EazyPod. It is recommended that the air pump is positioned higher than the water level in the EazyPod to prevent water flowing back into the air pump when it is switched off. However, the air valve should be in the off position, and the air pump switched off or in use elsewhere when not in the cleaning mode.

Air Valve On

Air Valve Off

OPERATING THE EAZYPOD

Getting Started

Completely empty your bag of K1 Micro into the inner chamber **C**. It is essential NEVER to remove or add any media other than the 18 Litres supplied. Cleaning and maintaining the EazyPod will depend on flow rate, feed, stocking, blanket weed etc. An EazyPod on a summer pond with heavy blanket weed will need more frequent maintenance than a pond in December with no food fed. Be aware that any movement of the EazyPod's K1 Micro whilst the pond pump is in operation will dislodge the waste collected and will be sent back to the pond and clarity will suffer. If this does happen, the EazyPod will eventually remove this waste again in time. The cleaning regimes for both pump and gravity installations are listed on pages 20 and 21.

Please Note: A pump-fed system will need cleaning when the water level in chamber **B/C** has risen and is close to the overflow assembly. A gravity fed system will need cleaning before the water level in chamber **B** has lowered by 4 inches / 100mm.

System running and maintenance

To achieve optimum water quality and clarity we recommend that the EazyPod be air backwashed and purged on a regular basis. The frequency of cleaning will depend on the loading of the pond. However, the filter must be cleaned regularly. In the event of a blockage, the circulation pump will become starved on a gravity system or the chamber will overflow on a pump-fed system. The overflow assembly is a built-in overflow. Should a blockage of the K1 Micro occur, water will bypass the stainless steel screen and return to the pond.

CLEANING A PUMP-FED EAZYPOD

Cleaning - Pump-fed Procedure

1. Switch off the water pump.
2. Wait until water has stopped flowing back to the pond.
3. Turn on your air pump and open the air valve on the EazyPod.
   In a few seconds the K1 Micro will start to 'agitate' and circulate,
   thereby self-cleaning.
4. After the K1 Micro has been aerated for a minimum of two minutes, open valve **F**
   and completely drain the EazyPod.
5. Once it is drained, close valve **F**.
6. Turn on your circulation pump to refill the EazyPod.
7. If you want to clean the EazyPod for a second time, repeat steps 1 to 6.

PLEASE NOTE 2 cleaning cycles will normally be needed to completely clean the K1 Micro.
For a dirty pond, 3 may be necessary.

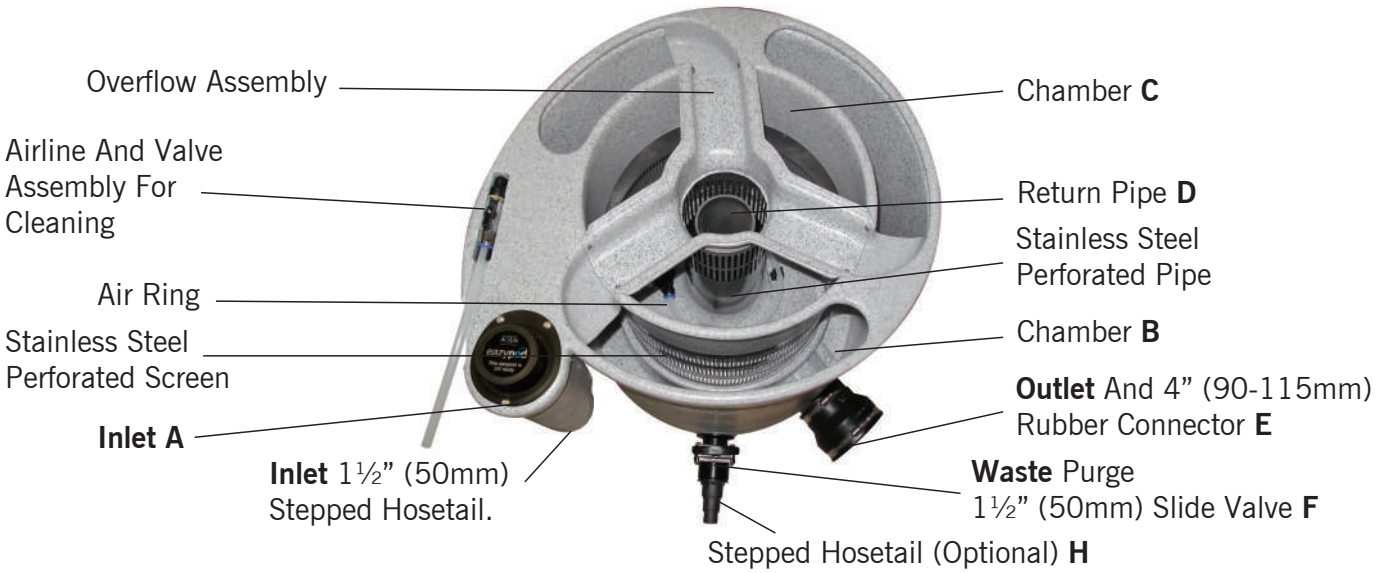

Optional Cleaning - Pump-fed Procedure - Using the cleaning pipe

The new inlet configuration of the EazyPod means that it is not essential to use the cleaning pipe to maintain the water level during cleaning.

However, should you find that excessive debris is splashed down the return pipe during cleaning you can use the cleaning pipe provided to isolate the unit from your pond.

Insert the cleaning pipe then follow the steps 1 to 5 above.

Remember to remove the cleaning pipe before switching your pump back on.

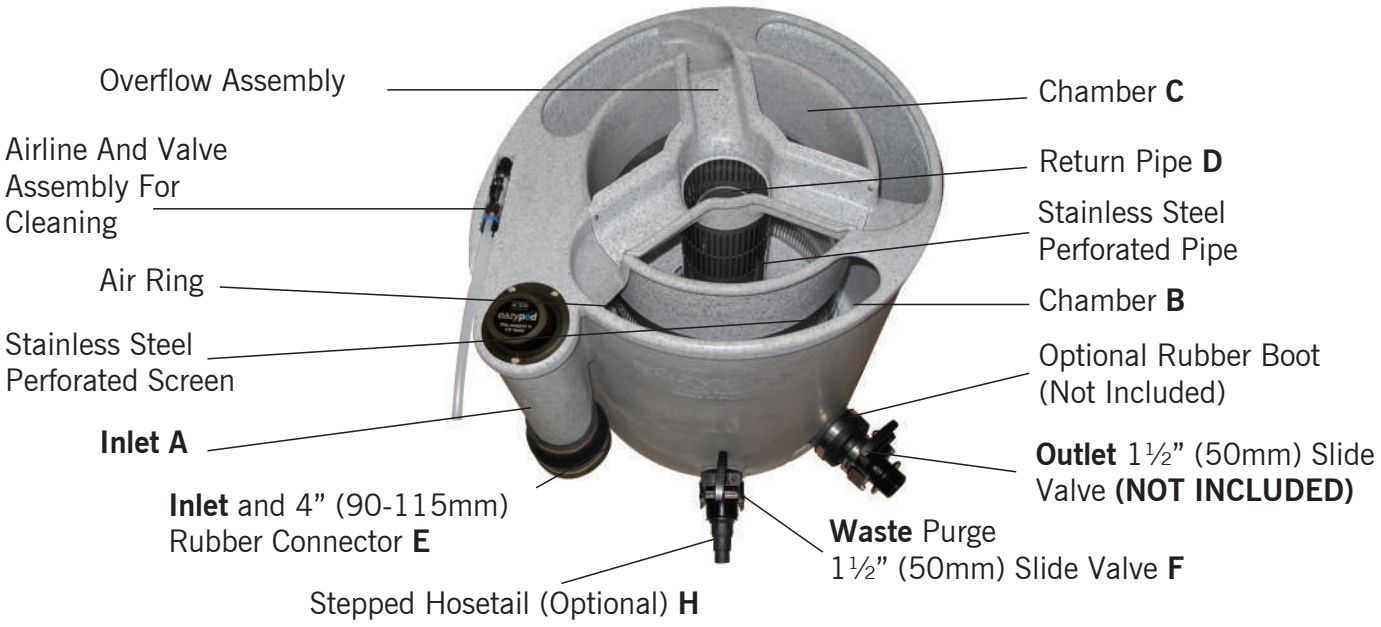

CLEANING A GRAVITY-FED EAZYPOD

Cleaning – Gravity Fed Procedure

1. Stop the circulation pump.
2. Wait a short period of time to allow the water levels within the EazyPod to stabilise.
3. Insert the cleaning pipe into the plastic return pipe **D**.
   This will prevent waste going back to the pond.
4. Isolate the pond from the EazyPod by closing the valve on the inlet line.
5. Close the slide valve which you have fitted after your circulating pump.
6. Turn on your air pump and open the air valve on the EazyPod. In a few seconds the K1 Micro media will start to 'agitate' and circulate, thereby self cleaning.
7. After the K1 Micro has been aerated for a minimum of two minutes, open valve **F** to completely drain the EazyPod.
8. When drained close valve **F** and open your inlet valve to refill the EazyPod.
9. Allow the K1 Micro to agitate again for a minimum of two minutes.
10. Open valve **F** to drain again. If the water in the EazyPod is still not 100% clean, repeat the process.
11. Once the K1 Micro is clean, turn off your air pump or re-divert it and close the air valve on the EazyPod.
12. Remove the cleaning pipe.
13. Close valve **F.**
14. Open the slide valve after the pump to refill the EazyPod from the pond and start your circulation pump.

PLEASE NOTE 2 cleaning cycles will normally be needed to completely clean the K1 Micro. For a dirty pond, 3 may be necessary. When doing more than one cleaning cycle, there is no need to remove the cleaning pipe and switch the air pump off. Only after the final clean can you switch off the air pump, remove the cleaning pipe and run the EazyPod as normal.

TROUBLE SHOOTING

PROBLEM	SOLUTION
My K1 Micro stays on the surface of the water and will not sink	The K1 Micro when brand new is buoyant and will want to float on the surface of the water. This is perfectly normal. As soon as fish have been added to the pond it takes the K1 Micro approximately 24 to 48 hours to absorb the water and become semi-buoyant in the EazyPod.
The K1 Micro doesn't move well during the cleaning cycle	The air pump is either not powerful enough or there isn't enough water in the EazyPod. Check all air fittings and line for leaks. Make sure you haven't inadvertently added more K1 Micro than the 18 Litres.
The pond gets dirty after cleaning	Check that you have turned your circulating pump off, so that the dirt in the K1 Micro hasn't returned to the pond. If the K1 Micro appears to bubble (boil) above the outlet water level during cleaning, some dirt may return back to the pond. This is not an issue. Please ensure that the EazyPod has gone through a minimum of 2 to 3 cleaning cycles.
Too much maintenance, poor clarity, or EazyPod overflowing	Make sure that you haven't exceeded the maximum flow rate. Please ensure that the EazyPod has gone through a minimum of 2 to 3 cleaning cycles.
Is the cleaning pipe, no longer needed?	Due to the running height of the EazyPod now being set by the inlet pipe configuration, it is no longer necessary to use the cleaning pipe during Pump Fed cleaning. However, you can if you prefer, use the cleaning pipe provided during Pump Fed cleaning. See page 20 for details. On Gravity Fed set ups, the cleaning pipe should be used during cleaning.

EVOLUTION AQUA

INNOVATION IN WATER

eazypod™

WARRANTY

This product is guaranteed against defects in material and workmanship for 2 years from the date of purchase, under normal usage. The guarantee DOES NOT APPLY in case of improper use, negligence, lack of maintenance or accidental damage to the EazyPod. If the EazyPod fails due to a manufacturing fault within this period it will be either repaired or replaced free of charge. Liability is limited to replacement of the faulty product only; no other costs will be reimbursed. This guarantee is not transferable and does not affect your statutory rights. This guarantee does not confer any rights other than those expressly set out above.

Do not attempt to tamper with the EazyPod components, other than as directed in this instruction manual, as doing so will invalidate the warranty.

The manufacturer or supplier shall not be responsible, or held liable for any damages caused by defective components or materials of this product; or for loss incurred by interruption of service; or any consequential/incidental damages and expenses arising from the production, sale use or misuse of this product or any other consequential loss.

Any warranty claim must be accompanied by a valid, dated proof of purchase.

Evolution Aqua and its dealers shall not be held liable for any loss of fish, plants or any other livestock as a result of any failure or defect of this product.

The installation and use of your product outside of our recommendations as printed in this manual may also void the warranty.

Evolution Aqua reserve the right to change this product specification without prior notice.
